

THE INSIDR

Business Plan

AI Trading Intelligence Platform

Version 3.0 | April 2026 | Confidential

Detail	Information
Platform Name	The Insidr
Platform Type	AI Trading Intelligence — Web Application
Target Market	Retail traders — Forex, Stocks, Indices, Crypto
Revenue Model	Monthly subscription — Pro and Elite tiers
Pro Tier	\$28/month or \$280/year (save 2 months)
Elite Tier	\$79/month or \$790/year (save 2 months)
Document Version	Version 3.0 — Final confirmed specification

SECTION 1: EXECUTIVE SUMMARY

Executive Summary

What The Insidr Is

The Insidr is a web-based AI-powered trading intelligence platform for retail traders. It does not execute trades. It provides research, analysis, signals, and performance tools that help retail traders make better informed decisions across Forex, Stocks, Indices, and Cryptocurrency markets. Every feature is designed to close the gap between how retail traders and institutional traders approach the market.

Mission Statement

Mission

To give retail traders access to the same institutional-grade market intelligence, analysis, and decision-making tools that professional traders use — delivered through a single platform at a price accessible to everyone.

Subscription Model

Tier	Monthly	Annual	Annual Saving
Pro	\$28/month	\$280/year	\$56 (2 months free)
Elite	\$79/month	\$790/year	\$158 (2 months free)

What The Platform Contains

AI Trade Ideas

Real-time trade setups generated by a multi-layer confluence engine combining technical price action analysis and fundamental macro drivers across all four markets. Ideas are published automatically whenever a genuine high-conviction setup is identified. Every idea includes entry zone, stop loss, TP1/TP2/TP3, R:R ratios, confidence score (0-100%), technical reasoning, fundamental reasoning, key invalidation level, risk environment alignment badge, and a full idea status tracker.

AI Bias Cards

Swing trade bias and day trade bias generated per asset every 30 minutes. Each card shows directional label, strength qualifier, what supports the bias, and what could flip it with specific price levels referenced.

Live News and Sentiment

Real-time financial news feed covering all four markets with AI sentiment scoring on every article. Market sentiment gauges (Forex, Stocks, Indices, Crypto) updated every 30 minutes. Most bullish and most bearish assets ranked in real time.

Economic Calendar

Full economic calendar with AI pre-event analysis and post-event analysis published within minutes of each data release. Daily and weekly views. View Insidr Data button on every event.

Economy Pages

Dedicated macro intelligence pages for nine countries: USA 🇺🇸, Eurozone 🇪🇺, UK 🇬🇧, Japan 🇯🇵, Australia 🇦🇺, New Zealand 🇳🇿, Canada 🇨🇦, Switzerland 🇨🇭, China 🇨🇳. Each covers central bank rates, yield levels, RoC charts, economic data (CPI, GDP, PMI, Employment), risk sentiment, and recent news.

Yield Differential Engine

2-year and 10-year government bond yield spreads calculated per currency pair. Shows yield advantage direction, widening or narrowing, and pair alignment. Yield RoC charts on asset breakdown with Levels, Spread, and RoC toggle. 1W, 1M, 3M period selector.

Risk On / Risk Off Engine

Global macro sentiment scored every 15 minutes across seven indicators: VIX, S&P 500, JPY, Gold, US 10-year yield, DXY, and commodity index. Outputs Risk On, Neutral, or Risk Off. Used to filter trade idea confluence scoring and displayed on the dashboard.

Watchlist

User-configured asset monitor with live prices, 24hr change, and AI bias badge per asset. Clicking any asset loads it on the Dashboard as the full asset breakdown.

View Insidr Data

A universal magnifying glass icon button appearing next to every individual item across the platform — news articles, calendar events, trade ideas, asset breakdowns, economy page

components. Generates a focused Claude-powered AI briefing about that specific item. Never a page-level summary — always item-level intelligence. Cached 15-30 minutes.

AI Chat Assistant

Persistent AI trading mentor on every page via floating widget. Remembers conversation history across sessions. Full context of user's watchlist, markets, experience level, and trading performance. Pro: 50 messages per day. Elite: unlimited.

Trade Journal and Portfolio Tracker

Tradezella-style trading journal with four tabs: Overview, Journal, Analytics, and Calendar. Manual entry, CSV import, and automatic broker sync via MT4/MT5 EA, IBKR Flex, Binance API, and Coinbase API.

Alerts and Notifications

Five alert types: trade idea, economic calendar, news, risk sentiment shift, and bias change. Two channels at launch: in-app notification centre and email. Every alert type has independent on/off toggles per channel. SMS added in a future release.

Key Differentiators

- Trade ideas generated from a genuine multi-layer confluence of technical price action and fundamental macro analysis — not rules-based signal generation
- Risk On/Off engine actively suppresses ideas that contradict the global macro environment
- Institutional-grade yield differential and rate of change analysis surfaced at the individual pair level
- Tradezella-style journal combined with forward-looking trade ideas, news, and AI signals in one subscription
- AI chat assistant with persistent memory personalised to each user's trading history
- Economy pages giving traders a complete country-level macro picture for all major currencies
- Pure price action technical analysis — no lagging indicators, no RSI, no MACD, no Bollinger Bands, no Fibonacci retracements
- View Insidr Data button providing contextual AI intelligence at the individual item level across the entire platform

SECTION 2: PLATFORM PAGES

Platform Pages

Page	Route	Description
Landing Page	/	Public marketing page — hero, trade idea showcase, features, testimonials, CTA
Sign Up	/auth/signup	Email and password registration — Supabase Auth
Sign In	/auth/signin	Email and password login
Forgot Password	/auth/forgot	Password reset email
Pricing	/pricing	Pro vs Elite comparison — public
Onboarding	/onboarding	5-step wizard — runs once after signup
Dashboard	/dashboard	Main hub — daily briefing, chart, bias, news, Risk On/Off
Trade Ideas	/ideas	AI trade idea feed with filters
Trade Idea Detail	/ideas/[id]	Full single idea page with chart and full reasoning
News and Sentiment	/news	Live news feed and market sentiment gauges
Economic Calendar	/calendar	Economic events with AI pre and post-event analysis
Economy Landing	/economy	9 country card grid
Economy Country	/economy/[country]	Per-country macro intelligence page
Watchlist	/watchlist	User asset monitor — clicking loads asset on Dashboard
Journal	/journal	Trade journal, analytics, calendar view
Alerts	/alerts	Alert management and notification centre
Settings	/settings	Profile, notifications, display, subscription and billing

SECTION 3: ONBOARDING FLOW

Onboarding Flow

Full-screen wizard running once after signup. Users cannot access the platform until onboarding is complete. Progress bar at top. Back and Next buttons on every step. Background analytics tracking every step entry, completion, and abandonment to identify friction points.

Step 1 — Experience Level

- Three options: Beginner (0-1 years), Intermediate (1-3 years), Advanced (3+ years)
- Single select. Personalises AI chat assistant tone and explanation depth.

Step 2 — Preferred Markets

- Four options: Forex, Stocks, Indices, Crypto — multi-select
- Personalises dashboard, news feed, trade ideas, and sentiment to selected markets

Step 3 — Account Currency

- Eight options: USD , GBP , EUR , AUD , CAD , JPY , NZD , CHF 
- Single select. Used for display across the platform.

Step 4 — Build Watchlist

- Pre-populated suggestions based on markets selected in Step 2
- Search to find any asset. Minimum 1 asset required to proceed.

Step 5 — Choose Subscription Plan

- Pro vs Elite side-by-side comparison with full feature list
- Monthly and annual billing toggle. Subscription required to access the platform.
- Stripe Checkout on selection

Funnel Analytics

Every step fires analytics events: step viewed, step completed, step back, abandoned, completed, plan selected, trial started. Used to identify drop-off points and optimise the flow over time.

SECTION 4: TRADE IDEA GENERATOR

Trade Idea Generator

Core Value Proposition

The trade idea generator is the primary reason users subscribe to The Insidr. It combines institutional-grade technical and fundamental analysis into a single confluence scoring system and generates trade ideas automatically whenever a genuine high-conviction setup is identified across any of the platform's tracked assets.

Markets and Assets Covered

Market	Assets Covered	Count
Forex	EURUSD, GBPUSD, USDJPY, AUDUSD, USDCAD, USDCHF, NZDUSD, EURJPY, GBPJPY, EURGBP	10 pairs
Stocks	Top 100 most traded US stocks by average daily volume	100 stocks
Indices	US30, NAS100, SPX500, DAX, NIKKEI, Gold (XAUUSD), Silver (XAGUSD), Oil (USOIL)	8 instruments
Crypto	Top 20 cryptocurrencies by market capitalisation	20 assets

Scanner Configuration

Setting	Value	Notes
Scanner frequency	Every 5 minutes	Runs across all tracked assets every 5 minutes continuously
Max active ideas per asset	3	One per timeframe — Scalp, Day Trade, and Swing can coexist
Long and Short simultaneously	Scalp only	A Long and Short idea can only coexist on the same asset if one of them is a Scalp trade. Same timeframe cannot have both directions.
Publishing	Auto-publish	Every qualifying idea is published immediately and automatically — no manual review queue
Minimum confidence to publish	50%	Ideas below 50% confluence score are suppressed and never published

Setting	Value	Notes
Deduplication window	2 hours	Same asset, same direction, similar levels within 2 hours is suppressed as duplicate

Timeframe Classifications

Type	Chart Timeframes	Typical Hold Time	Expiry
Scalp	1m, 5m	Minutes to a few hours	24 hours from generation
Day Trade	5m, 15m, 1H	Intraday — same day close	24 hours from generation
Swing	1H, 4H, Daily	2 to 7 days	7 days from generation

Technical Signals — Primary

Primary Technical Signals

At least one Primary technical signal must be present for an idea to be generated. These are the highest-weight signals in the confluence scoring system and form the foundation of every setup.

1. VWAP — Daily and Weekly (Highest Weight)

Session VWAP resets at each session open (London, New York, Tokyo, Sydney) with plus and minus 1 standard deviation bands. Weekly VWAP resets every Monday with plus and minus 1 SD bands. VWAP reclaims and rejections are the most real-time signal available — they reflect where the average participant is positioned relative to the current price. Confluence between session and weekly VWAP alignment in the same direction is weighted as the strongest single technical signal on the platform.

2. Market Structure

Break of Structure (BOS) and Change of Character (CHoCH) detection across multiple timeframes simultaneously. Equal highs and lows flagged as liquidity pools. Trend direction assessed per timeframe through higher highs and higher lows for bullish structure, and lower highs and lower lows for bearish structure. Multi-timeframe structure alignment is assessed — the strongest setups have all relevant timeframes pointing in the same direction.

3. Key Price Levels

Support and resistance zones identified from swing highs and lows over the last 50 candles per timeframe, rated by number of touches and time held. Supply and demand zones identified from strong impulsive price moves — the origin candle of an impulse marks where orders were placed. Psychological round numbers flagged per market (every 50 and 100 pip level for forex,

major round numbers for crypto, stocks, and indices). Price approaching a confluence of multiple level types simultaneously is weighted most heavily.

4. Key Liquidity Levels

Previous day high and low, previous week high and low, and previous month high and low tracked per asset and updated in real time. Equal highs and equal lows flagged as buy-side and sell-side liquidity pools respectively — price frequently sweeps these levels before reversing as stop orders are triggered. These levels act as magnets for price and are weighted heavily in the scoring system when price is approaching them from the opposite direction.

5. Volume Profile

Previous day Point of Control (POC) — the price level with the highest traded volume in the previous session. Value Area High (VAH) and Value Area Low (VAL) — the range containing 70% of previous day's volume. High volume nodes and low volume nodes identified. The POC is used as a key magnet level for both entries and targets. Breakouts above VAH or below VAL with momentum signal continuation. Rejections at these levels signal mean reversion setups.

Technical Signals — Secondary

Secondary Technical Signals

Secondary signals add confluence weight when present but are not required on their own to generate an idea. They increase the confidence score and improve the quality of the setup when they align with Primary signals.

200 EMA — 4H and Daily Only

Calculated exclusively on the 4H and Daily timeframes. Price position relative to the 200 EMA establishes the macro directional bias — above is macro bullish, below is macro bearish. The EMA slope direction adds directional weight. Price approaching the 200 EMA from either side flags a major decision point. Bounces and rejections at the 200 EMA are high-weight secondary signals.

Trend Lines — Minimum 3 Touches

Trend lines are auto-detected from swing pivot points. A minimum of 3 confirmed pivot point touches is required to validate any trend line — this eliminates false trend lines formed from only 2 touches. Diagonal support and resistance from validated trend lines adds directional confluence when price approaches.

Chart Patterns — 13 Types

Thirteen chart pattern types detected algorithmically: Head and Shoulders, Inverse Head and Shoulders, Double Top, Double Bottom, Triple Top, Triple Bottom, Bull Flag, Bear Flag, Ascending Triangle, Descending Triangle, Symmetrical Triangle, Rising Wedge, Falling Wedge. Patterns only contribute confluence when they form at a significant primary signal level.

Candlestick Signals at Key Levels Only

Bullish and bearish engulfing candles, pin bars, hammers, shooting stars, doji, and inside bars detected algorithmically. Critically, candlestick signals are only flagged when they form at a significant primary signal level — support, resistance, supply zone, demand zone, POC, VWAP, 200 EMA, or liquidity level. A candlestick signal in isolation with no confluence from a primary level carries zero weight.

Fundamental Signals — Primary

Primary Fundamental Signals

Primary fundamental signals carry the highest weight in the fundamental layer. They represent the macro environment in which any trade idea must operate. A strong technical setup that contradicts the primary fundamental signals will have its confluence score significantly reduced.

1. Risk On / Risk Off Environment (Highest Weight)

The single most important macro filter. The Risk On/Off engine scores 7 global macro instruments every 15 minutes: VIX, S&P 500, JPY strength, Gold direction, US 10-year yield, DXY, and commodity index. Each votes Risk On (+1), Neutral (0), or Risk Off (-1). The composite score determines the global label. A trade idea in the direction aligned with the environment receives a significant confluence boost. An idea contradicting the environment receives a significant reduction — potentially suppressing it entirely. When the label changes state all active ideas are re-evaluated.

2. Yield Differential — 2yr and 10yr Spread and Rate of Change

The most important fundamental driver for Forex pairs. 2-year and 10-year government bond yield spreads are calculated per currency pair showing which country holds the yield advantage and whether that advantage is widening or narrowing. The rate of change of the spread — not just the level — is a critical signal. A widening spread in one country's favour with accelerating momentum is the strongest possible fundamental confirmation for a directional trade on that pair. Yield confluence is scored separately for 2yr and 10yr and combined for a total yield score.

3. Central Bank Policy Divergence

When two central banks are moving in opposite directions — one hiking while the other cuts or holds — it creates a structural directional bias in the currency pair that can persist for months.

Central bank stance per country is tracked from Trading Economics: current rate, direction (hiking, cutting, holding), next meeting date, and market-implied expectations. A strong divergence between the two countries in a pair adds significant fundamental confluence in the direction of the hawkish currency.

Fundamental Signals — Secondary

Secondary Fundamental Signals

Secondary fundamental signals add supporting context and confluence weight. They are not sufficient on their own to generate a high-confidence idea but strengthen the overall case when they align with primary signals.

4. Live Economic Data — CPI, GDP, PMI, Employment

Recent readings of the four key economic indicators per country feed into the fundamental assessment. These matter because they drive central bank expectations — a hotter than expected CPI reading increases the probability of a rate hike, which strengthens the currency. Data is pulled from Trading Economics and compared against the previous reading and market consensus. A surprise deviation from expectations in a direction that supports the idea adds secondary confluence.

5. Fundamental Driver Profiles per Asset

Each tracked asset has a hardcoded fundamental driver profile covering its key economic sensitivities and typical behavioural characteristics. Examples: AUD and NZD sensitivity to Chinese economic data and commodity prices, CAD's correlation with crude oil, CHF's safe haven characteristics and inverse relationship with risk appetite, JPY's sensitivity to US 10-year yields and equity market direction, Gold's inverse relationship with real yields and DXY, Silver's dual role as precious and industrial metal. These profiles add contextual weight when the profile's drivers are in the same direction as the idea.

6. Cross-Market Correlations

Before finalising any idea the engine checks correlated markets. AUD and NZD pairs are checked against iron ore, coal, and Chinese equity indices. CAD is checked against crude oil (WTI and Brent). CHF is checked against VIX and risk sentiment. JPY pairs are checked against the Nikkei 225 and US 10-year yield direction. Gold is checked against DXY and US real yields. Silver is checked against Gold. Equities are checked against VIX. A correlated market confirming the idea's direction adds secondary confluence. Contradiction reduces confluence and flags a potential divergence warning on the idea.

7. News Sentiment Scoring

The most short-term and highest-noise fundamental signal. Recent high-impact news sentiment for the specific asset is checked at generation time. Strong bullish news supporting a long idea adds minor confluence. Strong bearish news supporting a short adds minor confluence. Ranks last among fundamental signals because sentiment can reverse within hours and is the least reliable signal over any timeframe beyond scalp and day trade. Additionally, if a high-impact economic event is scheduled within 2 hours of idea generation, the confidence score is reduced as a risk management measure to protect users from entering positions immediately before major volatility events.

Confluence Scoring System

Every potential setup is scored across all technical and fundamental layers before the Claude API generation call is made. Pre-screening reduces unnecessary API calls — only assets that pass minimum conditions proceed to full generation.

Signal	Category	Points
VWAP session and weekly aligned in same direction	Technical Primary	+3
Market structure aligned across all relevant timeframes	Technical Primary	+3
Market structure aligned on majority of timeframes	Technical Primary	+1
Price at key support/resistance zone	Technical Primary	+2
Price at supply or demand zone (fresh/untested)	Technical Primary	+2
Price at previous day/week/month liquidity level	Technical Primary	+2
Price at POC (previous day)	Technical Primary	+2
Price at VWAP level (session or weekly)	Technical Primary	+2
Price at VWAP plus/minus 1 SD band	Technical Primary	+1
Price at psychological round number	Technical Primary	+1
Price at 200 EMA (4H or Daily)	Technical Secondary	+2
Price at trend line (minimum 3 touches)	Technical Secondary	+1
Chart pattern detected at significant level	Technical Secondary	+2
Candlestick signal at primary signal level	Technical Secondary	+1
Cross-market correlation confirms direction	Technical Secondary	+1

Signal	Category	Points
Cross-market correlation contradicts direction	Technical Secondary	-1
Risk On/Off environment aligns with direction	Fundamental Primary	+3
Risk On/Off environment contradicts direction	Fundamental Primary	-4
Both 2yr and 10yr yield spreads confirm direction	Fundamental Primary	+3
2yr yield spread only confirms direction	Fundamental Primary	+2
10yr yield spread only confirms direction	Fundamental Primary	+1
Yield spreads contradict direction	Fundamental Primary	-3
Strong central bank policy divergence in idea direction	Fundamental Primary	+2
CB policy divergence contradicts direction	Fundamental Primary	-2
Economic data surprise supports direction	Fundamental Secondary	+1
Fundamental driver profile supports direction	Fundamental Secondary	+1
Fundamental driver profile contradicts direction	Fundamental Secondary	-1
High-impact news sentiment supports direction	Fundamental Secondary	+1
High-impact event scheduled within 2 hours	Fundamental Secondary	-1

Total Score	Confidence %	Action
0 to 5	Below 50%	Suppressed — not published
6 to 8	50% to 65%	Published — Low confidence
9 to 11	66% to 79%	Published — Medium confidence
12 to 14	80% to 89%	Published — High confidence
15+	90% to 99%	Published — Very High confidence

Claude API Idea Generation

Once a setup passes the minimum confluence threshold, a full Claude API call is made using the claude-sonnet-4-20250514 model. The prompt contains all context: asset, current price, all technical signal values and levels detected, market structure assessment, fundamental driver profile, live fundamental data, yield spread data, Risk On/Off state, and last 3 relevant high-impact news headlines. Claude returns a structured response containing direction, timeframe classification, confidence score, entry zone (high and low), stop loss level, TP1/TP2/TP3 levels, R:R ratios per target, invalidation level and description, full technical reasoning paragraph, full fundamental reasoning paragraph, and risk environment alignment assessment.

Idea Output — What Users See

- Direction badge — LONG or SHORT
- Timeframe badge — SCALP, DAY TRADE, or SWING
- Confidence badge with percentage and rating label
- Asset name and full name
- Entry zone — price range to enter the trade
- Stop loss — exact level with description
- TP1, TP2, TP3 — three targets with R:R ratio per target
- Invalidation level — price level that cancels the setup
- Technical reasoning — full paragraph explanation
- Fundamental reasoning — full paragraph explanation
- Risk environment alignment badge
- Status tracker — Active, Entry Hit, TP1/TP2/TP3 Hit, Stopped Out, Invalidated
- View Insidr Data button — on-demand AI explanation of why this idea was generated

Idea Lifecycle and Status

Status	Trigger	User Notification
Active	Idea generated and published	Trade idea alert fires (if enabled)
Entry Hit	Price enters the entry zone	Alert fires — trade is live
TP1 Hit	Price reaches TP1 level	Alert fires — first target reached
TP2 Hit	Price reaches TP2 level	Alert fires — second target reached
TP3 Hit	Price reaches TP3 level	Alert fires — all targets hit
Stopped Out	Stop loss level is hit	Alert fires — trade stopped
Invalidated	Invalidation level is breached before entry	Idea kept visible with warning badge — not removed
Expired	Idea reaches maximum age without triggering	Auto-archived — Scalp/Day Trade 24hrs, Swing 7 days

Platform Performance Statistics

Publicly displayed on the Trade Ideas page to build user trust and transparency. Updated daily from recorded idea outcomes.

- Overall win rate — percentage of ideas that hit TP1 or better before stop loss
- Average R:R achieved across all closed ideas
- Total ideas published this month
- TP1, TP2, and TP3 hit rates independently
- Win rate by market (Forex, Stocks, Indices, Crypto)
- Win rate by timeframe (Scalp, Day Trade, Swing)

All statistics include the disclaimer: Past performance of AI-generated trade ideas does not guarantee future results. Statistics are based on the platform's own outcome tracking methodology.

SECTION 5: INTELLIGENCE ENGINES

Intelligence Engines

Risk On / Risk Off Engine

Runs every 15 minutes. Scores 7 global macro instruments via Twelve Data. Each instrument votes +1 (Risk On), 0 (Neutral), or -1 (Risk Off). Sum determines the global label: +3 to +7 is Risk On, -2 to +2 is Neutral, -3 to -7 is Risk Off. Displayed on the dashboard widget with all 7 individual votes visible. Feeds into trade idea confluence scoring. When label changes state: all active trade ideas re-evaluated, risk sentiment shift alerts fire for users with that alert enabled.

Indicator	Risk Off Signal	Risk On Signal
VIX	Above 20 and rising	Below 15 and falling
S&P 500	Down more than 0.5%	Up more than 0.5%
JPY	Strengthening	Weakening
Gold	Rising more than 0.3%	Falling more than 0.3%
US 10Y Yield	Falling — flight to bonds	Rising — risk appetite
DXY	Surging — safe haven bid	Falling
Commodities	Falling — demand concerns	Rising — growth optimism

Yield Differential Engine

Tracks 2-year and 10-year government bond yields for 8 countries: USA 🇺🇸, Germany 🇩🇪 (EUR proxy), UK 🇬🇧, Japan 🇯🇵, Australia 🇦🇺, New Zealand 🇳🇿, Canada 🇨🇦, Switzerland 🇨🇭. Updates every 15 minutes via Twelve Data. Calculates per-pair: 2yr spread, 10yr spread, spread direction (widening or narrowing), which country the spread favours, pair alignment check, daily rate of change percentage. Displayed as a line chart on the asset breakdown (Levels/Spread/RoC toggle, 1W/1M/3M period) and on Economy pages. Feeds into trade idea confluence scoring.

News and Sentiment Engine

Ingests financial news every 60 seconds from Benzinga (stocks, forex, indices) and CryptoPanic (crypto). Every article is sent to Claude API for sentiment scoring on ingest — classified as Bullish, Bearish, or Neutral with a score from -1 to +1. Market and asset sentiment gauges

recalculated every 30 minutes from three weighted components: news sentiment (40%), price momentum from Twelve Data (40%), and volume/volatility signals (20%). Score 0-100 maps to: 0-20 Strongly Bearish, 21-40 Bearish, 41-59 Neutral, 60-79 Bullish, 80-100 Strongly Bullish.

AI Bias Card Engine

Generates Swing and Day Trade bias per asset every 30 minutes. Fetches OHLCV data and key levels from Twelve Data, combines with yield data, risk environment, and recent news, then sends to Claude API for bias generation. Each bias card outputs: directional label, strength qualifier, 4 bullet points supporting the bias with specific price levels, and 4 bullet points explaining what could flip it. Cached in Redis with 30-minute TTL. All watched assets are refreshed on the same cycle.

SECTION 6: ECONOMY PAGES

Economy Pages

Dedicated macro intelligence pages for nine countries. Country selector tabs across the top for instant switching. Each page contains View Insidr Data buttons on every individual component — not a single page-level button.

Country	Flag	Currency	Central Bank
United States		USD	Federal Reserve (Fed)
Eurozone		EUR	European Central Bank (ECB)
United Kingdom		GBP	Bank of England (BoE)
Japan		JPY	Bank of Japan (BoJ)
Australia		AUD	Reserve Bank of Australia (RBA)
New Zealand		NZD	Reserve Bank of New Zealand (RBNZ)
Canada		CAD	Bank of Canada (BoC)
Switzerland		CHF	Swiss National Bank (SNB)
China		CNY	People's Bank of China (PBoC)

Per Country Page Components

- Central Bank Panel — current rate, direction, next meeting, cut/hold/hike probabilities, AI stance summary — View Insidr Data button
- Yield Levels Panel — 2yr yield, 10yr yield, daily bps change, yield curve status (Normal/Flat/Inverted) — View Insidr Data button
- Yield RoC Chart — Recharts LineChart, Levels/Spread/RoC toggle, 1W/1M/3M periods, zero line, green above/red below on RoC view
- Economic Data Panel — CPI, GDP, PMI, Employment cards with latest reading, change vs previous, next release date — View Insidr Data button per card
- Risk Sentiment — current Risk On/Off implication for that currency — View Insidr Data button
- Recent High Impact News — last 5 articles for that currency — View Insidr Data button per article

SECTION 7: TRADE JOURNAL

Trade Journal & Portfolio Tracker

A comprehensive Tradezella-style trading journal and performance analytics system. Four tabs: Overview, Journal, Analytics, Calendar. Primary retention driver — once users log trades they are deeply invested.

Trade Import Options

- Manual entry — full form with all fields
- CSV import — pre-built parsers for MT4/MT5, IBKR, Tradovate, Binance, Coinbase, Robinhood
- MT4/MT5 auto-sync — custom Expert Advisor (EA) in MQL4/MQL5 pushing live trades to the platform
- IBKR Flex Web Service — automated trade history sync
- Binance API — crypto trade history sync
- Coinbase Advanced API — crypto trade history sync

Per Trade Fields

- Asset, market, direction, entry/exit price, stop loss, take profit, position size
- Entry and exit date/time stored in UTC displayed in user timezone
- Timeframe, strategy, emotional state (Calm/Anxious/Overconfident/FOMO)
- Mistake tags — pre-built: Moved stop loss, Overtraded, Revenge trade, Entered too early, Entered too late, Ignored trading plan, Traded during news, Poor risk management, FOMO entry
- Notes (free text), screenshot upload (stored in Supabase Storage)
- P&L auto-calculated in dollar amount and R multiples

Analytics Breakdowns

- Win rate, average R:R, profit factor, drawdown, max consecutive wins and losses
- Breakdown by market, trading session, day of week, timeframe, strategy, emotional state, mistake tag
- Equity curve, monthly P&L bars, win/loss distribution
- Mistake cost tracker — each tag with total count and total dollar cost

SECTION 8: ALERTS & NOTIFICATIONS

Alerts & Notifications

Alert Type	Triggers When	Key Filters
Trade Idea Alert	New idea published for a watched asset	Confidence level, direction, timeframe type
Economic Calendar Alert	X minutes before a scheduled event	Lead time (15/30/60/120 min), impact level
News Alert	High or medium impact article for watched asset	Impact level, sentiment direction
Risk Sentiment Shift Alert	Global Risk On/Off label changes state	Direction of shift
Bias Change Alert	AI bias flips direction for a watched asset	Timeframe (Swing/Day/Both), flip direction

Delivery Channels — Launch

- In-app notification centre — bell icon in top bar, 30-day history, unlimited
- Email — via SendGrid or Resend, unlimited
- SMS — removed at launch, added in a future release

Every alert type has independent on/off toggles per channel. Quiet hours setting suppresses all notifications between user-configured times. Managed in Settings > Notifications.

SECTION 9: AI CHAT ASSISTANT

AI Chat Assistant

Persistent AI trading mentor on every page via floating widget in the bottom-right corner. Collapsed: circular gradient button. Expanded: 400px wide, 600px tall chat panel.

Capabilities

- Answer general trading questions in plain English
- Analyse any specific asset on demand using live price, bias, VWAP, 200 EMA, and recent news
- Review user's past trades from the journal and identify specific weaknesses
- Explain economic events and news with market impact context
- Educate on trading concepts calibrated to user's experience level

Memory and Context

- Full conversation history stored in PostgreSQL
- Last 20 messages loaded as context on every new message
- User profile injected into every system prompt: name, preferred markets, experience level, win rate, most common mistake tags, last 5 trades
- Pro tier: 50 messages per day — Elite tier: unlimited

Guardrails

- Never says you should buy or sell a specific asset
- Always frames as analysis and education, not advice
- Every trade-related response ends with: This is not financial advice — always do your own research

SECTION 10: MONETISATION & PROJECTIONS

Monetisation & Financial Projections

Revenue Model

Pure subscription revenue. No advertising. No affiliate commissions. No data selling. The platform's only revenue source is monthly and annual subscription fees from Pro and Elite tier members.

Tier	Monthly Price	Annual Price	Annual MRR Equivalent
Pro	\$28/month	\$280/year (\$23.33/month equivalent)	\$23.33/month
Elite	\$79/month	\$790/year (\$65.83/month equivalent)	\$65.83/month

Subscription Tier Feature Split

Feature	Pro	Elite
Trade Ideas	Unlimited	Unlimited + Priority
AI Chat	50 messages/day	Unlimited
News Feed	Full access	Full access
Economic Calendar	Full access	Full access
Economy Pages	Full access	Full access
Watchlist	Full access	Full access
Trade Journal	Full access	Full access
Alerts	In-app + Email	In-app + Email + SMS (future)
View Insidr Data	Full access	Full access
Annual Billing	\$280/yr	\$790/yr

Revenue Projections

Milestone	Subscribers	Pro/Elite Split	Est. Monthly Revenue
Launch (Month 1)	100	80% Pro / 20% Elite	\$3,800
Month 3	500	75% Pro / 25% Elite	\$19,125
Month 6	1,500	70% Pro / 30% Elite	\$58,950
Month 12	5,000	65% Pro / 35% Elite	\$166,750
Month 18	12,000	60% Pro / 40% Elite	\$418,560
Month 24	25,000	60% Pro / 40% Elite	\$872,000

Cost Structure

Cost Category	Estimated Monthly Cost	Notes
Anthropic Claude API	\$200-500	Usage-based — scales with user count and feature usage
Twelve Data API	\$50-150	WebSocket + REST — scales with connection count
Trading Economics	\$50-100	Macro data for economy pages and CB rates
Benzinga API	\$50-100	Financial news feed
CryptoPanic API	\$0-30	Free tier sufficient at launch
Supabase	\$25-100	Database, auth, storage — scales with users
Vercel (Frontend)	\$20-100	Scales with traffic
Railway (Backend)	\$50-150	FastAPI server + Redis + background workers
SendGrid / Resend	\$20-50	Email alerts and transactional email
PostHog / Mixpanel	\$0-50	Analytics — free tier sufficient early
Stripe fees	2.9% + 30c	Per transaction — factored into pricing
Total Est. at launch	\$465-1,330	Breakeven at approximately 50-100 subscribers

SECTION 11: TECHNOLOGY STACK

Recommended Technology Stack

Advisory Note

The following stack is a recommendation based on the platform's requirements. Final decisions rest with the development team.

Layer	Technology	Purpose
Frontend	React + Tailwind CSS	Component-based UI, utility styling
Data Charts	Recharts	Yield RoC charts, journal equity curve, analytics
Trading Charts	TradingView Widget	Candlestick charts — free embed, no API key
State Management	React Query + Zustand	Server state caching, global client state
Backend	Python + FastAPI	Async API server, AI workloads
Background Jobs	APScheduler or Celery	Scanner, bias refresh, news ingestion, yield updates
Cache	Redis	Bias cache, sentiment scores, View Insidr Data responses
AI	Anthropic Claude API	claude-sonnet-4-20250514 — all AI features
Database	Supabase (PostgreSQL)	Primary database, auth, file storage
Payments	Stripe	Subscriptions, billing, customer portal
Email	SendGrid or Resend	Alert emails, transactional email
Analytics	PostHog or Mixpanel	Onboarding funnel, user behaviour
Frontend Hosting	Vercel	CI/CD, CDN, preview deployments
Backend Hosting	Railway	FastAPI server, workers, Redis
Market Data	Twelve Data	Live prices, yields, OHLCV, calendar
Macro Data	Trading Economics	CB rates, economic indicators
News	Benzinga + CryptoPanic	Financial and crypto news feeds

SECTION 12: THREE-PHASE BUILD PLAN

Three-Phase Build Plan

Stage 1 — Platform Foundation

Stage 1 Goal

Build and deploy every page and feature with live real data. The only exception is the trade idea generator — its pages are built but show placeholder content. By the end of Stage 1 the platform is fully functional and live.

Stage 1 delivers: Auth and Stripe subscriptions, 5-step onboarding with funnel analytics, fully live dashboard (all 11 components), live watchlist with WebSocket prices, live news and sentiment (AI scoring on every article), live economic calendar with AI analysis, live economy pages for all 9 countries, live Risk On/Off engine, live yield differential engine, live AI bias cards, live AI chat assistant, full trade journal with broker sync, alerts and notifications (in-app and email), View Insider Data button across the platform, and full settings and subscription management.

Stage 2 — Trade Generator

Stage 2 Goal

Build, test, and deploy the AI trade idea generation engine. The platform becomes fully intelligent. Trade idea alerts begin firing. This is the activation of the platform's core value proposition.

Stage 2 delivers: 5-minute market scanner across all 4 markets and 138 assets, full technical signal detection (all primary and secondary signals), fundamental signal integration with live data, confluence scoring system, Claude API idea generation, automatic publishing, deduplication logic, idea status monitoring every 5 minutes, platform performance statistics, and shadow mode testing before go-live.

Shadow Mode Testing Required

Before publishing any trade ideas to users the generator must run in shadow mode — generating ideas internally without publishing — for sufficient time to review quality

manually. Only go live with the generator once idea quality is confirmed to a satisfactory standard.

Stage 3 — UI Finalisation

Stage 3 Goal

Polish, performance, mobile responsiveness, landing page, and production readiness. The platform goes from functional to launch-ready.

Stage 3 delivers: full design system audit and enforcement, landing page, animations and micro-interactions, full mobile responsiveness, performance optimisation (target sub-2 second page loads), complete loading and error states on all components, security audit, legal documents (Terms of Service, Privacy Policy, Financial Disclaimer, Cookie Policy), and pre-launch checklist completion.

SECTION 13: LEGAL & REGULATORY

Legal & Regulatory

Important

Independent legal counsel should be sought in each jurisdiction of operation to confirm platform activities fall within financial information provision rather than regulated financial advice. Regulations vary between Australia, the UK, the EU, and the US.

Financial Information Disclaimer

The platform provides AI-generated trade ideas and market analysis for informational and educational purposes only. It does not execute trades, manage funds, or provide personalised financial advice. This disclaimer must appear on the landing page, every trade idea card and detail page, AI chat assistant responses, Terms of Service, and the onboarding flow.

Required Legal Documents

- Terms of Service — platform use, subscription terms, cancellation, refunds, limitation of liability
- Privacy Policy — GDPR compliant for EU users, data collection, retention, deletion
- Financial Information Disclaimer — not financial advice, for educational purposes only
- Cookie Policy

Data Privacy

- GDPR compliance required for EU users
- Delete account must fully purge all user data from the system immediately upon confirmation
- Supabase handles data storage — confirm data residency requirements for target markets

Payments

- Stripe handles all payment processing — PCI-DSS compliant, the platform never touches raw card data
- terms must be clearly communicated before Stripe Checkout
- Cancellation policy must be clearly stated — access continues to end of current billing period

SECTION 14: MACHINE LEARNING ROADMAP

Machine Learning Roadmap

Launch Requirement

None of the V1 platform features require training a machine learning model. The platform launches entirely on Claude API with prompt engineering. ML features are a future roadmap that improve the platform as outcome data accumulates.

V1 — Available at Launch

FinBERT Financial Sentiment Scoring

Pre-trained NLP model fine-tuned on financial text. Classifies news as bullish, bearish, or neutral significantly faster and cheaper than Claude API. Available from HuggingFace (ProsusAI/finbert). Recommended for news sentiment scoring to reduce Claude API costs.

V2 — 3 to 6 Months Post-Launch

Trade Idea Quality Scoring (XGBoost)

Once approximately 500 to 1,000 ideas have been published with recorded outcomes, an XGBoost model can be trained to predict the probability of a successful outcome. The confidence score transitions from rule-based confluence counting to evidence-based probability from actual performance data.

Personalised Idea Ranking

A recommendation model learning each user's preferences from behaviour — which ideas they click, save, alert, and log. Re-ranks the ideas feed per user. Requires 200+ active users with sufficient interaction data.

V3 — 12+ Months Post-Launch

Price Movement Probability Model

Trained on historical OHLCV data to predict probability distribution of price movement over the next N candles for a given market condition. Adds a statistical probability layer to the confidence score.

Computer Vision Chart Pattern Detection

A CNN trained on labelled chart images to detect patterns from visual price representation. More accurate than algorithmic detection. Requires labelled training data and GPU infrastructure.

User Churn Prediction

Trained on user behaviour data to predict which subscribers are at risk of cancelling. Triggers automated retention actions when a user crosses a risk threshold. Requires 6+ months of data.

Market Anomaly Detection

An Isolation Forest or Autoencoder model trained on normal multi-market behaviour. Flags when multiple markets simultaneously show unusual correlated behaviour — earlier warning of risk events than the rule-based Risk On/Off system.
