

THE INSIDR

Three-Phase Development Plan

Complete build specification organised by development phase

Version 1.0 | March 2026 | Confidential

Phase	Name	Focus	Output
Stage 1	Platform Foundation	All pages and features built and live with real data	Fully functional platform — trade generator excluded
Stage 2	Trade Generator	AI trade idea engine built, tested, and live	Complete AI-powered platform
Stage 3	UI Finalisation	Polish, mobile, landing page, production ready	Launch-ready product

S T A G E 1

Platform Foundation

14 features live with real data

S T A G E 2

Trade Generator

AI trade idea engine live

S T A G E 3

UI Finalisation

Polish and production ready

S T A G E 1

Platform Foundation

All features built and live with real data — trade generator excluded

Stage 1 — Platform Foundation

Stage 1 Goal

Build and deploy every page and feature on the platform with live real data. By the end of Stage 1 users can sign up, onboard, explore the full platform, view live market intelligence, use the AI chat assistant, log trades in the journal, set alerts, and manage their account. The only feature not yet live is the trade idea generator — its display pages are built but show placeholder content.

What is Live in Stage 1

Every API integration is live. Every page is built. Real data flows throughout the platform. The trade generator engine is the only exception — its pages exist but the AI-powered idea generation runs in Stage 2.

1. Authentication & Subscription

Supabase Auth

Full email/password signup, login, email verification, password reset. JWT session management. Subscription gating middleware on all authenticated routes reading from the subscriptions table.

Stripe Subscription

Pro (\$28/mo or \$280/yr) and Elite (\$79/mo or \$790/yr) tiers. Monthly and annual billing. 7-day free trial on both plans. Stripe Checkout, webhooks for state sync, upgrade/downgrade flows, cancellation flow.

2. Onboarding Wizard

5-Step Onboarding Flow

Experience level selection, preferred markets, account currency, watchlist builder with pre-populated suggestions, subscription plan selection via Stripe Checkout. Full-screen wizard with progress bar. Cannot access platform until complete. Funnel analytics firing on every step entry, completion, and abandonment.

3. Dashboard — Fully Live

Live Dashboard

All 11 components live with real data: AI Daily Briefing (Claude API), Session Clock, Pairs Tab Strip (Twelve Data WebSocket), TradingView Chart, AI Bias Cards (Claude API every 30 mins), Live Price Overlay, What Supports the Bias, What Could Flip It, Live News Sidebar (Benzinga + CryptoPanic), Risk On/Off Widget (Twelve Data — 7 instruments every 15 mins). Sidebar collapsible. News sidebar collapsible.

Asset Breakdown

Full asset breakdown on dashboard when any pair is selected: bias cards, supports/flips, View Insider Data button (Claude API), two-column layout with live news feed and yield line chart (Levels/Spread/RoC toggle, 1W/1M/3M periods). Real yield data from Twelve Data.

4. Watchlist — Live

Live Watchlist

Assets grouped by market with live WebSocket prices. AI bias badge per row. Collapsible groups. Add asset via Twelve Data symbol search. Clicking any asset loads it on the dashboard. All real data.

5. News & Sentiment — Live

Live News Feed

Real-time news from Benzinga (stocks, forex, indices) and CryptoPanic (crypto). Claude API sentiment scoring on every article on ingest. Impact badges, sentiment badges, asset tags. Auto-refreshes every 60 seconds. View Insider Data button on every article.

Live Sentiment Gauges

Four market sentiment gauges (Forex/Stocks/Indices/Crypto) calculating composite scores every 30 minutes from news sentiment (40%), price momentum (40%), and volume/volatility (20%). Most bullish and most bearish assets ranked in real time.

6. Economic Calendar — Live

Live Economic Calendar

Real event data from Twelve Data. Daily and weekly views. Impact filtering, currency filtering, watchlist toggle. Live countdown timers. AI pre-event analysis (Claude API) on every event detail panel. Post-event analysis generated within minutes of actual data release. View Insider Data button on every event.

7. Economy Pages — Live

9 Country Economy Pages

Live central bank rates and meeting expectations from Trading Economics. Live 2yr and 10yr yields from Twelve Data. Live economic data (CPI, GDP, PMI, Employment) from Trading Economics. Yield rate of change chart with Levels/Spread/RoC toggle. Live Risk On/Off implication. Live news feed per currency. View Insider Data button on every individual component.

8. Risk On/Off Engine — Live

Live Risk On/Off Engine

All 7 indicators live via Twelve Data: VIX, S&P 500, JPY, Gold, US 10Y Yield, DXY, Commodity Index. Scoring logic runs every 15 minutes. Dashboard widget displays current label and all 7 individual votes. Risk sentiment shift alerts fire when label changes state. Note: Risk On/Off confluence integration into trade ideas is Stage 2.

9. Yield Differential Engine — Live

Live Yield Engine

All 16 yield instruments live (8 countries x 2yr + 10yr). Spreads calculated per pair. Direction (widening/narrowing) tracked. Pair alignment checked. Daily RoC calculated and stored. Yield chart live on asset breakdown and economy pages. Note: Yield confluence scoring into trade ideas is Stage 2.

10. AI Chat Assistant — Live

Live AI Chat

Floating widget on every page. Claude API (claude-sonnet-4-20250514). Persistent memory across sessions — conversation history in PostgreSQL, user profile summary injected into every prompt. Analyses assets on demand using live price and bias data. Reviews journal trades. Explains events and news. Calibrated to user experience level. Pro: 50 messages/day. Elite: unlimited.

11. Trade Journal & Portfolio Tracker — Live

Full Trade Journal

All four tabs live: Overview (performance summary, recent trades), Journal (trade log with all fields, log trade form), Analytics (win rate, R:R, breakdowns by market/session/day/strategy/emotional state/mistake tag, equity curve, monthly P&L bars), Calendar view (green/red/grey days, P&L per cell). Manual trade entry fully working.

Broker Import & Sync

CSV import with pre-built parsers for MT4/MT5, IBKR, Tradovate, Binance, Coinbase, Robinhood. Custom CSV mapper for unsupported brokers. MT4/MT5 Expert Advisor (custom MQL4/MQL5 build) auto-syncing executed trades in real time. IBKR Flex Web Service integration. Binance API and Coinbase Advanced API trade history sync.

12. Alerts & Notifications — Live

Live Alerts System

All 5 alert types live: trade idea alerts (fires when generator is live in Stage 2), economic calendar alerts (pre-event + post-event), news alerts, risk sentiment shift alerts, bias change alerts. Two channels: in-app notification centre (bell icon, 30-day history) and email (SendGrid/Resend). Every alert type has independent on/off toggles per channel. Create alert flow, alert management page.

13. View Insidr Data — Live

View Insidr Data Button

Magnifying glass icon button live on every individual item across the platform: news articles, calendar events, economy page components, asset breakdown on dashboard, bias badges on watchlist. Aggregates all available cached platform data and sends to Claude API for a focused item-level briefing. Cached 15-30 minutes per item in Redis.

14. Settings & Subscription — Live

Full Settings Page

Profile tab (name, email, password, avatar, experience level, preferred name). Notifications tab (5 alert types x 2 channels matrix, quiet hours). Markets and Display tab (preferred markets, default asset, chart timeframe, display currency, timezone). Subscription and Billing tab (current plan, Pro vs Elite comparison, Stripe billing management, upgrade/downgrade, cancellation flow). Delete account buried with type-to-confirm flow.

Trade Ideas Page — Stage 1 State

Trade Ideas in Stage 1

The Trade Ideas page (/ideas) and Trade Idea Detail page (/ideas/[id]) are fully built in Stage 1 with all UI components, filters, card layouts, and detail view. However they display placeholder/sample trade ideas rather than live AI-generated ones. The live trade idea generator is Stage 2. This means users can see exactly what trade ideas will look like and the full UX is testable before the engine goes live.

Stage 1 — APIs to Integrate

API	Purpose	Stage 1 Usage
Supabase	Database + Auth + Storage	Auth flows, all database tables, file storage for journal screenshots
Stripe	Payments	Subscription tiers, onboarding plan selection, billing management, webhooks
Anthropic Claude API	AI features	Daily briefing, bias cards, sentiment scoring, chat assistant, View Insider Data, calendar AI, post-event analysis
Twelve Data (REST + WebSocket)	Market data	Live prices, OHLCV, yields, economic calendar, symbol search, Risk On/Off instruments
Trading Economics	Macro data	Central bank rates, meeting expectations, CPI, GDP, PMI, Employment for all 9 countries
Benzinga API	News	Financial news — stocks, forex, indices
CryptoPanic API	Crypto news	Crypto-specific news feed
SendGrid or Resend	Email	Alert emails, auth emails, billing receipts
PostHog or Mixpanel	Analytics	Onboarding funnel tracking, user behaviour events

Stage 1 — Database Tables to Create

All tables from the full specification document must be created in Supabase with Row Level Security enabled from day one. The complete schema is detailed in Section 18 of the Developer Specification Document. Key tables for Stage 1 functionality:

- users, user_preferences, subscriptions, onboarding — core user data
- user_watchlist, asset_bias_cache, asset_levels_cache — watchlist and market data
- risk_sentiment_cache, yield_data, pair_yield_spreads, yield_roc_history — engines

- country_economy_cache — economy pages
- news_articles, market_sentiment, asset_sentiment_scores, economic_events — news and calendar
- trades, mistake_tags, user_strategies, broker_connections — journal
- user_alerts, notifications — alerts
- chat_conversations, chat_messages, user_ai_profile — AI chat

Trade idea tables (trade_ideas, idea_status_history, platform_performance_stats, scanner_results) should be created in Stage 1 even though they will not be populated until Stage 2.

Stage 1 — Background Jobs to Build

Job	Frequency	What it does
News ingestion pipeline	Every 60 seconds	Fetch new articles from Benzinga and CryptoPanic, send to Claude for sentiment scoring, store in news_articles
Sentiment score calculation	Every 30 minutes	Calculate market and asset sentiment composite scores from news + price + volume, update market_sentiment and asset_sentiment_scores
Asset bias card generation	Every 30 minutes	Fetch OHLCV and levels data, send to Claude for bias generation, update asset_bias_cache for all watched assets
Risk On/Off calculation	Every 15 minutes	Fetch all 7 instruments from Twelve Data, calculate votes and label, update risk_sentiment_cache
Yield data update	Every 15 minutes	Fetch all 16 yield instruments, calculate spreads and RoC, update yield_data, pair_yield_spreads, yield_roc_history
Economic calendar sync	Every 6 hours	Fetch upcoming events from Twelve Data, store/update economic_events
Post-event analysis trigger	Every 60 seconds (around event times)	Check for actual values on released events, trigger Claude analysis job when actual value detected
Economy page data refresh	Every 6 hours	Fetch CB rates, economic indicator readings from Trading Economics, update country_economy_cache
AI daily briefing generation	Once per day per user (morning)	Generate personalised briefing for each user from their watchlist and market data, cache in daily_briefings table

S T A G E 2

Trade Generator

AI trade idea engine — built, tested, and live

Stage 2 — Trade Generator

Stage 2 Goal

Build, test, and deploy the AI trade idea generation engine. By the end of Stage 2 the platform is generating and publishing real trade ideas with full confluence scoring across technical and fundamental signals. Trade idea alerts begin firing. The platform is complete and fully intelligent.

What Stage 2 Builds

Stage 2 is entirely focused on the trade idea generation engine. Everything else is already live from Stage 1. Stage 2 activates the core value proposition of The Insider.

1. Market Scanner

15-Minute Asset Scanner

Background job running every 15 minutes across all tracked assets (approximately 50 core assets across Forex, Stocks, Indices, Crypto). For each asset the scanner fetches current OHLCV data across multiple timeframes, calculates all technical signals, runs pre-screening conditions, and determines whether to trigger a full Claude API idea generation call. Pre-screening filters reduce unnecessary API calls — only assets that pass minimum conditions proceed to generation.

2. Technical Signal Detection

Market Structure Analysis

BOS (Break of Structure) and CHoCH (Change of Character) detection across 1H, 4H, and Daily timeframes simultaneously. Equal highs and lows flagged as liquidity pools. Trend direction (HH/HL vs LH/LL) assessed per timeframe. Multi-timeframe alignment checked — strongest ideas require all three timeframes aligned.

Key Price Level Identification

Support and resistance zones identified from swing highs and lows (last 50 candles per timeframe), rated by touch count and time held. Supply and demand zones identified from strong impulse moves. Round psychological numbers flagged per market (every 50 and 100 pip level for forex, major round numbers for crypto/stocks/indices). Updated every 4 hours per asset.

Key Liquidity Levels

Previous day high and low, previous week high and low, previous month high and low tracked per asset. Equal highs and lows flagged as liquidity pools. These levels act as magnets — price frequently sweeps them before reversing. Weighted heavily in confluence scoring when price approaches these levels.

Volume Profile

Previous day Point of Control (POC) — price level with highest traded volume. Value Area High (VAH) and Value Area Low (VAL). High volume nodes and low volume nodes. POC used as key magnet level for entries and targets. Breakouts above VAH or below VAL flagged as momentum signals. Rejections at these levels flagged as mean reversion signals.

VWAP Analysis

Session VWAP reset at each session open (London, NY, Tokyo, Sydney) with plus and minus 1 standard deviation bands. Weekly VWAP reset every Monday with plus and minus 1 SD bands. VWAP reclaim and rejections detected. Confluence between session and weekly VWAP alignment in same direction weighted as strong signal.

200 EMA

Calculated on 4H and Daily timeframes only. Price position relative to 200 EMA noted (above = macro bullish, below = macro bearish). EMA slope direction tracked. Price approaching 200 EMA flagged as major decision point. 200 EMA bounces and rejections trigger high-confidence signals.

Trend Lines and Chart Patterns

Trend lines auto-detected from swing pivot points with minimum 2 touches to validate. 13 chart pattern types detected algorithmically: Head and Shoulders, Inverse H&S, Double Top, Double Bottom, Triple Top, Triple Bottom, Bull Flag, Bear Flag, Ascending Triangle, Descending Triangle, Symmetrical Triangle, Rising Wedge, Falling Wedge.

Candlestick Signals

Bullish and bearish engulfing candles, pin bars, hammers, shooting stars, doji, and inside bars

detected algorithmically. Crucially these are only flagged when they form at a significant price level (S/R zone, supply/demand zone, POC, VWAP, 200 EMA, liquidity level). Candlestick signals in isolation carry no weight.

3. Fundamental Signal Integration

Yield Differential Confluence

Existing yield engine data (already live from Stage 1) integrated into confluence scoring. 2yr spread direction adds up to +2 points. 10yr spread alignment adds +1. Both spreads confirming adds +3 total. Contradiction deducts up to -3. Divergence detection (price moving opposite to yields) flags mean reversion opportunity and adds +2.

Risk On/Off Confluence

Existing Risk On/Off engine (already live from Stage 1) integrated into confluence scoring. Idea direction aligned with current environment adds +2. Contradiction deducts -3 and may suppress the idea entirely. Warning badge added to published ideas that contradict the environment.

Fundamental Driver Profiles

Hardcoded per-asset profiles covering key economic drivers, sentiment indicators, and typical behaviour. Live data fetched for each driver at scan time: central bank rates from Trading Economics, commodity prices from Twelve Data, yield spreads from yield engine, VIX and equity indices. Fundamental alignment adds up to +2 confluence points. Contradiction deducts -2.

News Sentiment Confluence

Most recent high-impact news sentiment for the asset checked at generation time. Strong bullish news supporting a long idea adds +1. Strong bearish news supporting a short adds +1. Upcoming high-impact event within 2 hours noted as volatility risk and deducts -1 (to protect users from entering into news events).

Cross-Market Correlations

Correlated markets checked before finalising any idea: AUD/NZD pairs checked against iron ore and Chinese equities, CAD against crude oil, CHF against VIX and risk sentiment, JPY pairs against US 10Y yield and Nikkei, Gold against DXY and real yields. Correlated market confirming adds +1. Contradiction deducts -1.

4. Confluence Scoring System

Every potential setup is scored across all technical and fundamental layers before Claude is called. The total confluence score determines the confidence percentage and whether the idea is published.

Signal	Points
Market structure aligned across all 3 timeframes (1H, 4H, Daily)	+3
Market structure aligned on 2 of 3 timeframes	+1
Price at key S/R level	+2
Price at 200 EMA (4H or Daily)	+2
Price at supply or demand zone (fresh/untested)	+2
Price at previous day/week/month liquidity level	+2
Price at POC (previous day)	+2
Price at VWAP level (session or weekly)	+1
Price at VWAP plus/minus 1 SD band	+1
Price at psychological round number	+1
Price at trend line	+1
Chart pattern detected at significant level	+2
Candlestick signal at significant level	+1
Cross-market correlation confirms	+1
Cross-market correlation contradicts	-1
Fundamental driver supports direction	+2
Fundamental driver contradicts direction	-2
Both 2yr and 10yr yield spreads confirm direction	+3
2yr yield spread only confirms	+2
Yield spreads contradict	-3
Risk environment aligns with direction	+2
Risk environment contradicts direction	-3
High-impact news supports direction (last 2 hours)	+1
High-impact event upcoming within 2 hours (volatility risk)	-1

Total Score	Confidence	Action
0 to 5	Below 50%	Suppressed — not published
6 to 8	50% to 65%	Published as Low confidence idea
9 to 11	66% to 79%	Published as Medium confidence idea

Total Score	Confidence	Action
12 to 14	80% to 89%	Published as High confidence idea
15+	90% to 99%	Published as Very High confidence idea

5. Claude API Idea Generation

Claude API Generation Call

Once confluence score passes the minimum threshold (50%), a full Claude API call is made with all context: asset, current price, all technical signal values and levels detected, market structure assessment across all timeframes, fundamental driver profile, live fundamental data, yield spread data, Risk On/Off state, and last 3 relevant news headlines. Claude returns a structured JSON response with direction, timeframe type, confidence, entry levels, SL, TP1/TP2/TP3, R:R ratios, invalidation level and description, technical reasoning paragraph, fundamental reasoning paragraph.

6. Idea Publishing and Deduplication

Publishing Logic

When Claude returns a valid idea, a deduplication check runs: if the same asset and direction with similar levels has been published in the last 2 hours, the new idea is suppressed. If unique, the idea is stored in trade_ideas table and immediately visible to all users. Trade idea alerts fire for users watching that asset. The idea status monitoring job begins checking every 5 minutes.

7. Idea Status Monitoring

Live Status Tracking

Background job runs every 5 minutes checking all active ideas against current prices from Twelve Data. When price enters the entry zone: status updated to Entry Hit, users with idea alerts notified. When TP1/TP2/TP3 hit: status updated, alert users. When stop loss hit: status updated to Stopped Out. When invalidation level breached: status updated to Invalidated. Expired ideas auto-archived: Scalp after 24hrs, Day Trade after 24hrs, Swing after 7 days.

8. Platform Performance Statistics

Public Performance Tracking

Every idea outcome recorded and aggregated into publicly displayed statistics on the Trade Ideas page: overall win rate, average R:R achieved, total ideas published this month, TP1/TP2/TP3 hit rates over rolling 30-day periods. Statistics updated daily. This transparency builds trust with retail users. Disclaimer required stating past performance does not guarantee future results.

9. Trade Idea Timeframe Classification

Type	Scanner Timeframes	Typical Hold Time	Expiry
Scalp	1m, 5m	Minutes to a few hours	24 hours
Day Trade	5m, 15m, 1H	Intraday — same day open and close	24 hours
Swing	1H, 4H, Daily	2 to 7 days	7 days

Stage 2 — Testing Requirements

Before Going Live

The trade generator must be thoroughly tested before publishing real ideas to users. Run in shadow mode first — generate ideas internally without publishing them. Review 50-100 shadow ideas manually for quality, accuracy of levels, and reasoning quality. Only go live with the generator once satisfied with output quality.

- Shadow mode testing — generate ideas without publishing, review quality manually
- Backtest confluence scoring — run historical data through the scanner and check if high-scoring setups would have been profitable
- Edge case testing — assets with low liquidity, gap opens, news events, weekend gaps
- Rate limiting verification — confirm Claude API calls are not exceeding budget through pre-screening
- Deduplication testing — confirm duplicate ideas at similar levels are correctly suppressed
- Expiry testing — confirm ideas expire correctly at the right times
- Alert firing testing — confirm trade idea alerts fire correctly on publication

Stage 2 — New Background Jobs

Job	Frequency	What it does
Asset scanner	Every 15 minutes	Scan all tracked assets, calculate confluence, trigger Claude generation for qualifying setups
Idea status monitor	Every 5 minutes	Check all active ideas against live prices, update statuses, fire notifications
Platform stats calculation	Daily	Aggregate idea outcomes into win rate, R:R, and hit rate statistics

S T A G E 3

UI Finalisation

Polish, performance, mobile, landing page, production ready

Stage 3 — UI Finalisation

Stage 3 Goal

Transform a fully functional platform into a production-ready, polished product that is ready for public launch. Focus is entirely on user experience quality, visual polish, performance, mobile responsiveness, and the public-facing landing page.

Design System Enforcement

Full Design System Audit

Audit every page against the confirmed design system: CSS variables applied consistently, Bebas Neue for all headings and large numbers, DM Sans for all body text, JetBrains Mono for all prices and numerical data. Border radius 8px standard, 12px for modals. Dark theme only, background always #080810. Purple (#7b2fff) for bearish/AI accents, gold (#d4900a) for bullish/premium accents, green (#00d68f) for positive, red (#ff4757) for negative.

Landing Page

Public Landing Page (/)

Full marketing page built for conversion. Sections: sticky navigation (logo + links + Sign In + Get Started), hero section (bold Bebas Neue headline with animated gold/purple shimmer, live scrolling price ticker), stats bar (4 markets, 50+ assets, 24/7 AI, win rate), trade idea showcase (full sample EUR/USD short idea card showing exactly what users get), features grid (6 feature cards), testimonials (3 cards), CTA section (gold Get Started Today button), footer (links, legal disclaimer). Dark theme matching app. Bull/bear split logo prominent.

Animations & Micro-Interactions

Page Load Animations

Staggered fade-up reveal on all major sections. Dashboard components animate in sequentially with slight delay between each. News articles slide in from top when new articles arrive. Bias cards have subtle refresh animation when updated. Loading skeletons on all data-dependent components while fetching.

Interaction Animations

Smooth expand/collapse on news sidebar and left navigation. Smooth slide-up on AI chat widget open. Smooth transitions between watchlist groups expanding and collapsing. Chart expand to fullscreen smooth transition. Pair tab strip smooth scroll. Tooltip fade-in on bias badge hover.

Mobile Responsiveness

Full Mobile Polish

The platform is web-first but must be fully usable on mobile and tablet. Left sidebar collapses to bottom navigation bar on mobile. Top bar pairs strip scrolls horizontally with touch. Dashboard chart takes full width on mobile with bias cards and news below. Trade ideas single column on mobile. Journal analytics stack vertically. All modals full-screen on mobile. Touch-friendly tap targets minimum 44px.

Performance Optimisation

Performance Audit

Audit and optimise: page load times (target under 2 seconds on desktop), WebSocket connection stability and reconnection handling, Redis cache hit rates (target above 90% for bias and sentiment data), image optimisation (journal screenshots lazy loaded), code splitting (route-based lazy loading for all pages), bundle size audit and reduction.

Loading & Error States

Complete State Coverage

Every data-dependent component needs three states fully designed: Loading (skeleton screens matching the component shape, not generic spinners), Error (clear error message with retry button), Empty (helpful prompt guiding the user, e.g. no trades logged yet shows journal onboarding CTA). No component should ever show a blank white space or unhandled JavaScript error to the user.

Onboarding Visual Polish

Onboarding Experience Polish

The onboarding wizard gets full visual polish: The Insidr bull/bear logo prominent at top, smooth step transition animations, market selection cards with asset examples and icons, progress bar with step labels, completion screen with brief animation. The first impression matters enormously for conversion and retention.

Security Audit

Pre-Launch Security Review

Row Level Security verified on all Supabase tables. API keys never exposed to frontend. Rate limiting on all Claude API endpoints. Input validation and sanitisation on all user-submitted data. Stripe webhook signature verification. Auth token expiry and refresh handling. HTTPS enforced. CORS configuration reviewed.

Legal and Compliance

Legal Documents

Terms of Service, Privacy Policy (GDPR compliant for EU users), Financial Information Disclaimer, and Cookie Policy must all be written, reviewed by legal counsel, and published before launch. Financial disclaimer must appear on the landing page, every trade idea, AI chat assistant, and onboarding flow. Performance statistics on Trade Ideas page must include a past performance disclaimer.

Pre-Launch Checklist

Item	Description	Owner
All pages responsive	Tested on iPhone, Android, iPad, and desktop browsers	Dev
Loading states complete	Every component has loading, error, and empty state	Dev
Error monitoring live	Sentry or equivalent capturing all runtime errors	Dev
Analytics live	PostHog/Mixpanel tracking all key events including onboarding funnel	Dev
Legal documents live	T&C, Privacy Policy, Disclaimer all published and linked	Legal
Stripe live mode	Switched from test to live Stripe keys	Dev
Email deliverability	SendGrid/Resend domain verified, SPF/DKIM	Dev

Item	Description	Owner
	configured	
Performance baseline	Page load under 2s, no console errors, no broken images	Dev
Security audit passed	RLS verified, no exposed keys, rate limiting confirmed	Dev
Mobile testing complete	All pages tested on at least 3 mobile screen sizes	Dev
Landing page live	Public landing page deployed at root domain	Dev
Custom domain	Custom domain configured on Vercel with SSL certificate	Dev
Trade generator quality	Shadow mode review passed, quality confirmed	Dev
Beta testing complete	Internal team + small group of real traders tested all features	QA
Support channel ready	Email or chat support channel established for launch	Business

PHASE SUMMARY

Complete Phase Summary

Feature / Component	Stage 1	Stage 2	Stage 3
Authentication (Supabase Auth)	Live	-	-
Stripe Subscriptions	Live	-	-
Onboarding Wizard	Live	-	Polish
Left Sidebar Navigation (collapsible)	Built	-	Polish
Top Bar + Pairs Tab Strip	Live	-	Polish
Dashboard — All Components	Live	-	Polish
Asset Breakdown (bias, yields, news)	Live	-	Polish
View Insidr Data Button	Live (all pages)	-	-
Watchlist (live prices + bias)	Live	-	-
Risk On/Off Engine (live data)	Live (dashboard display)	Confluence scoring	-
Yield Differential Engine (live data)	Live (asset + economy pages)	Confluence scoring	-
AI Bias Cards (live data)	Live	-	-
News & Sentiment (live feed + gauges)	Live	-	-
Economic Calendar (live + AI analysis)	Live	-	-
Economy Pages (9 countries, live data)	Live	-	-
AI Chat Assistant (live, persistent memory)	Live	-	-
Trade Journal (all tabs + broker sync)	Live	-	-
Alerts & Notifications (in-app + email)	Live	-	-
Settings & Subscription (full)	Live	-	-
Trade Ideas Page (UI built, placeholder data)	UI built	Live engine	-
